alogis-CustomerDataControl

The tool for managing control parameters

alogis-CustomerDataControl – clear management of data specifications in SAP®

Whilst in SAP Standard, control parameters are defined in Customising, with enhancements - i.e. User Exits, Call-Customer-Functions, BAdIs or Enhancement Points, as well as other in-house developments, such as reports or dialogue transactions - this is often done in separate Z tables.

Many of these database tables, however, contain a very limited number of data records. Creating a database table with the corresponding maintenance dialogue included is therefore very costly. Not to mention that for large systems, the overview of these multiple tables gets lost.

Why so complicated when it can be simple?

- Creating a database table for every small control table is expensive.
- Every developer programmes access to Z tables in a different way.
- Each maintenance dialogue for Z tables has a different set-up.

alogis-CustomerDataControl (alogis-CDC), records all control parameters of applications developed in-house in two central tables, without the need to create your own Z tables for every application.

How does alogis-CustomerDataControl work?

With **alogis-CustomerDataControl**, data specifications can be managed centrally and can be maintained using a uniform interface.

The user is therefore able to - at no additional development cost - adjust, enhance or change a business process.

In **alogis-CustomerDataControl**, the data is kept in two central tables.

A functional component forms the programming interface between these tables and the programmes requiring this data, and standardises them when data is accessed.

Features

- Uniform and convenient maintenance in the dialogue
- Access to the program is standardised
- Database is managed in just one table

System requirements

- SAP® ECC DIMP 5.0 or higher
- SAP® R/3® 4.7 with DI 4.7.1

Dialogue in **alogis-CustomerDataControl** (alogis CDC) to manage control parameters in SAP®.

Five good reasons to use alogis-CustomerDataControl

- 1 Central management of all control parameters relating to enhancement developments
- 2 Minimisation of additional Z tables
- 3 Logic for maintenance using uniform user dialogue
- 4 Standardised functional component for accessing control data in the program
- 5 Easy to set parameters in customised programs
