alogis-PAXolution

The SAP-compliant logistics kit for flexible mapping and the quick adaptation of complex logistics processes

alogis-PAXolution – the kit to help you automate logistic processes

Are your operational requirements getting more complex, with procedures and business processes changing more quickly? Mastering complexity in a highly dynamic market environment is a top priority for manufacturers, suppliers and service providers who want to have a competitive edge in the long term.

Do you need your IT to follow this promptly without having to wait for costly programming?

Then we have just the solution: **alogis-PAXolution**.

Flexible. Scalable. Multipliable.

The architecture of the **alogis-PAXolution** is what makes it special. Necessary booking steps are encapsulated in modules that can be easily linked to process chains during customising.

Without modifying existing procedures, processes and functions can be supplemented. This modular system thus provides unique flexibility and process security.

In connection with the **alogis-BackgroundApplicationControl** (alogis-BAC), the tool for performant background processing, the **alogis-PAXolution** enables you to accomplish a high degree of automation in operational procedures. The implementation itself is robust and secure. It allows for restarting any time in cases of errors.

Configurable. Quick to implement.

Thanks to existing basic settings, ready-made functional components - that can be linked to process chains without any programming - and the technical framework to implement new functions, the **alogis-PAXolution** is quickly ready for use.

The re-use of existing and proven process components minimises testing costs and implementation times because there is no longer any need to test processes from scratch. This reduces the workload for internal resources and achieves greater independence from external expertise.

Features

- Modular kit system
- Configuration instead of programming
- Well over 200 additional functions
- Easy to extend
- Control of parallel process chains
- Parallel background processing
- Automation of posting steps
- Standardisation of technical handling
- Template approach support
- Update and release capability

System requirements
- SAP® ECC DIMP 5.0 or higher
- SAP® R/3® 4.7 with DI 4.7.1

alogis-PAXolution – more possibilities creates added value...

Efficient. Transparent. Reduces workload.

By decoupling activities, posting steps are automated and stored in the background, thus reducing the workload for users. They can once again concentrate on their core tasks. Resulting shorter response times, error minimisation and reduced training costs lead to an increase in efficiency and a streamlining of operational procedures.

Taken from practice. For use in practice.

alogis-PAXolution is fully integrated in SAP®. With well over 200 functions tested in practice, the **alogis-PAXolution** significantly extends the SAP standard performance package in accordance with your logistic and industry-specific requirements. The release and upgrade capabilities are guaranteed, of course, due to the close-to-standard development. Thus, a high functional degree of coverage is combined with a high level of investment security.

Features

- Incoming Goods & Cross Dock
- Sequencing with subsequent rack fixing
- Multi-stage JIS rack as master data
- CKD / packaging and shipping
- JIT-based availability check
- Commissioning of mixed HUs
- WM integration of JIS/JIT
- Consolidation and palletising
- Stuffing and loading
- Dynamic scheduling
- Message management

Concept > Configuration > Test > GO LIVE > Support

*High process variance in a highly-dynamic setting often leads to a high level of time pressure when implementing new processes. The modular possibilities of the **alogis-PAXolution** offer logisticians with a high level of automation - for example of scan-based goods identification and high booking volumes - tangible added value.*

Five good reasons to use alogis-PAXolution

1. Design of new SAP processes
2. Update and release capability
3. Flexibility and process reliability
4. Program stability and security of investment
5. Reduction of development, testing and training costs
